

## Gemini 2.5 Pro Use log

I continued my conversation with Gemini about the project from last week as this is the same material and I wanted the model to keep the code context in mind. I then fed it the current week's prompt and went to see what it thought about how I should proceed. Gemini confirmed my suspicions that a simple method change to stack from linked list and then the appropriate name and documentation changes were all that would be needed so I went ahead and implemented that by pulling the new stack implementation from Gemini's example and making other appropriate changes. To make sure I didn't miss anything I then gave my code to Gemini to look it over to make sure I made all the appropriate changes. It said I did everything perfectly so I went on to change the documentation. I then uploaded this documentation for a final look over that being the code re-use paper and the UML diagram. It noticed a couple places where I forgot to change the word list to stack and so I corrected that and then was ready for submission from there.
